This is good, since it means that quantum mechanics is driving the result. For  $m = 0.1$  kg, find  $m^2gL^3/h^2 = 1064$ , and so  $T = 0.1$  sec  $\times (147/4 - 4) \sim 3$  sec. I'd say that's a surprising and...

Quantum mechanics is based on Schrödinger's wave equation and its solution. The solution of the wave equation brings the idea of shells, sub-shells and orbitals. The probability of finding an electron at a point within an atom is proportional to the  $|\psi|^2$  at that point, where  $\psi$  represents the wave-function of that electron.

In 1952 David Bohm adapted Louis DeBroglie's pilot wave theory, producing Bohmian mechanics, the first successful hidden variables interpretation of quantum mechanics. This theory, which posits an additional dynamical wave describing the position of a quantum particle, removes the concept of wave function collapse from his interpretation of quantum theory.
